About Us

Enterprise InfoTech is a technology consulting firm based in Gurgaon, India. We offer a wide range of technology related services, such as IT Consulting, Software Development and Technology Trainings. We mostly work on cutting-edge and upcoming technologies. However, we also have a vast expertise in many existing technologies as well.

At EIT, we strongly believe in the ability of technology to change the way we think, we live and we work. We put our core strength - our skills with next-generation technologies - to work towards harnessing the power of the technology for you. We try to make our solutions, a live and dynamic extension of your business operations, wherever you are.

The company celebrates its 10th year in 2008 and has successfully moved from being a simple

software development company to a consulting firm that offers complete all-round technology solutions rather than simply creating software based on some inputs.

Technologies

We work on many different technologies on both Microsoft as well as open source platforms. Here's a brief list on some platforms we have worked on:

- Microsoft .NET 1.0-3.5
- SharePoint
- InfoPath
- Exchange
- PHP
- SQL Server
- Oracle
- Business Intelligence
- Reporting Tools
- AJAX
- SilverLight
- Web Services
- And many, many more...

Services We Offer

We offer end-to-end technology solutions for companies, educational institutions, non-profit and non-

governmental organization, state and central government departments and other software companies. You can view a brief description of our services here and download e-brochures for our services from our website.

Consulting

Enterprise InfoTech offers a very high level of technology consulting services for organizations. With many years of experience in working with Information Technology, including software, hardware, infrastructure and services, EIT is able provide its clients with the best technology based solution that is required. Some of the services provided in the consulting area are:

- System study for infrastructure implementation
- Hands on technology solutions
- User Needs Analysis (UNA) for software development
- Technology expert for hiring interview panels

- Vendor evaluation for non technical organizations
- Vendor guidance and evaluation during implementation lifecycles
- Technology strategy and guidance for organizations

Training

Over the years, we have noticed that technology or its usage does not come easily to most users. Technology tends to frighten and awe non-technical users. Even technical users (like network administrators and developers) are not secure from this fear. New technologies emerge everyday and many technical users too find it overwhelming to keep abreast with them.

However, our experience with working with, dissecting and understanding the latest technologies lets us also be a source for dissemination of information. We can make the hardest of technologies easy to understand and explain in simple terms to the target audience with numerous examples of practical usage and

comparisons with concepts already familiar to them.

We provide technical training sessions in all technologies that we work in as mentioned above, as well as many others that individual members of Enterprise InfoTech are familiar with. We also participate in technical seminars and can make presentations in them. Some of the training we are currently offering include:

- Visual Studio 2008
- SQL Server 2008
- Windows Server 2008
- Internet Information Server 7
- SQL Server Business Intelligence using SSIS, SSRS & SSAS
- .NET 2.0/3.0/3.5
- SharePoint Solutions

Software Development

With the advancement of information technology, automating the information flow has become a necessity. We first understand the business processes that require to

be automated, suggest optimizations to these, and then develop a solution that can be easily understood, implemented and used, even by non-techno-savvy users. We mostly work in cutting edge technologies in both Microsoft platforms as well as open source ones. We have expertise in software development in the following platforms:

- ASP.NET 2.0/3.5
- SilverLight
- AJAX
- InfoPath 2007 Forms
- SharePoint Technologies
- PHP
- WPF, WCF, WF
- Commerce Server
- Web Services
- Databases like SQL Server, Oracle, MySQL
- XML

The above is not a comprehensive list of technologies that we've worked on. We have done projects

in Perl, Python, and other technologies as well.

Clients

We have worked with many organizations - small, medium and enterprise. Most of our clients have been repeat clients of ours - a testimony that speaks about their satisfaction with our services. The following list is only a few of the more well-known names

- Microsoft Corporation
- Cyber Media (I) Ltd.
- Max Healthcare
- RAMS Relationships
- Burson-Marsteller Genesis PR
- Godfrey Philips
- PepsiCo Ltd.
